

DS-MPE-CAN2L

PCIe MiniCard Dual CAN 2.0 Port Module

Rev A.1 April 2015

Revision	Date	Comment
A.0	4/25/2014	Initial release
A.1	4/09/2015	Updated Windows installation procedure

1. IMPORTANT SAFE HANDLING INFORMATION

WARNING!

ESD-Sensitive Electronic Equipment

Observe ESD-safe handling procedures when working with this product.

Always use this product in a properly grounded work area and wear appropriate ESD-preventive clothing and/or accessories.

Always store this product in ESD-protective packaging when not in use.

Safe Handling Precautions

This board contains a high density connector with many connections to sensitive electronic components. This creates many opportunities for accidental damage during handling, installation and connection to other equipment. The list here describes common causes of failure found on boards returned to Diamond Systems for repair. This information is provided as a source of advice to help you prevent damaging your Diamond (or any vendor's) embedded computer boards.

ESD damage – This type of damage is usually almost impossible to detect, because there is no visual sign of failure or damage. The symptom is that the board eventually simply stops working, because some component becomes defective. Usually the failure can be identified and the chip can be replaced. To prevent ESD damage, always follow proper ESD-prevention practices when handling computer boards.

Damage during handling or storage – On some boards we have noticed physical damage from mishandling. A common observation is that a screwdriver slipped while installing the board, causing a gouge in the PCB surface and cutting signal traces or damaging components.

Another common observation is damaged board corners, indicating the board was dropped. This may or may not cause damage to the circuitry, depending on what is near the corner. Most of our boards are designed with at least 25 mils clearance between the board edge and any component pad, and ground / power planes are at least 20 mils from the edge to avoid possible shorting from this type of damage. However these design rules are not sufficient to prevent damage in all situations.

A third cause of failure is when a metal screwdriver tip slips, or a screw drops onto the board while it is powered on, causing a short between a power pin and a signal pin on a component. This can cause overvoltage / power supply problems described below. To avoid this type of failure, only perform assembly operations when the system is powered off.

Sometimes boards are stored in racks with slots that grip the edge of the board. This is a common practice for board manufacturers. However our boards are generally very dense, and if the board has components very close to the board edge, they can be damaged or even knocked off the board when the board tilts back in the rack. Diamond recommends that all our boards be stored only in individual ESD-safe packaging. If multiple boards are stored together, they should be contained in bins with dividers between boards. Do not pile boards on top of each other or cram too many boards into a small location. This can cause damage to connector pins or fragile components.

Power supply wired backwards – Our power supplies and boards are not designed to withstand a reverse power supply connection. This will destroy each IC that is connected to the power supply (i.e. almost all ICs). In this case the board will most likely will be unrepairable and must be replaced. A chip destroyed by reverse power or by excessive power will often have a visible hole on the top or show some deformation on the top surface due to vaporization inside the package. **Check twice before applying power!**

Overvoltage on digital I/O line – If a digital I/O signal is connected to a voltage above the maximum specified voltage, the digital circuitry can be damaged. On most of our boards the acceptable range of voltages connected to digital I/O signals is 0-5V, and they can withstand about 0.5V beyond that (-0.5 to 5.5V) before being damaged. However logic signals at 12V and even 24V are common, and if one of these is connected to a 5V logic chip, the chip will be damaged, and the damage could even extend past that chip to others in the circuit

2. INTRODUCTION

2.1 Description

DS-MPE-CAN2L implements a CAN protocol bus controller that performs serial communications according to the CAN 2.0A and CAN 2.0B specifications. The protocol uses a multi-master bus configuration for the transfer of frames between nodes of the network and manages error handling with no burden on the host processor.

2.2 Features

- ◆ 2 CAN 2.0B ports with a 1Mbps data rate and programmable interrupts
- ◆ 31 receive buffers for improved performance
- ◆ 1 high priority transmit buffer and 16 standard priority transmit buffers
- ◆ 16 programmable acceptance filters
- ◆ 11-bit and 29-bit identifiers
- ◆ 500V port-to-port and input-to-output isolation
- ◆ Driver supports dual-independent and dual-redundant modes
- ◆ Latching connectors for increased ruggedness

2.3 Operating System Support

- ◆ Linux 2.6.16, 2.6.27, 2.6.31 and 2.6.32
- ◆ Windows 7

2.4 Mechanical, Electrical, Environmental

- ◆ PCIe MiniCard full size format
- ◆ Dimensions: 50.95mm x 30mm (2" x 1.18")
- ◆ -40°C to +85°C ambient operating temperature
- ◆ Power input requirements: +3.3VDC +/- 5%

3. PACKING LIST

The DS-MPE-CAN2L product comes with the PCIe MiniCard hardware assembly, a cable kit with two dual serial cables, and a hardware kit containing jumpers and mounting screws.

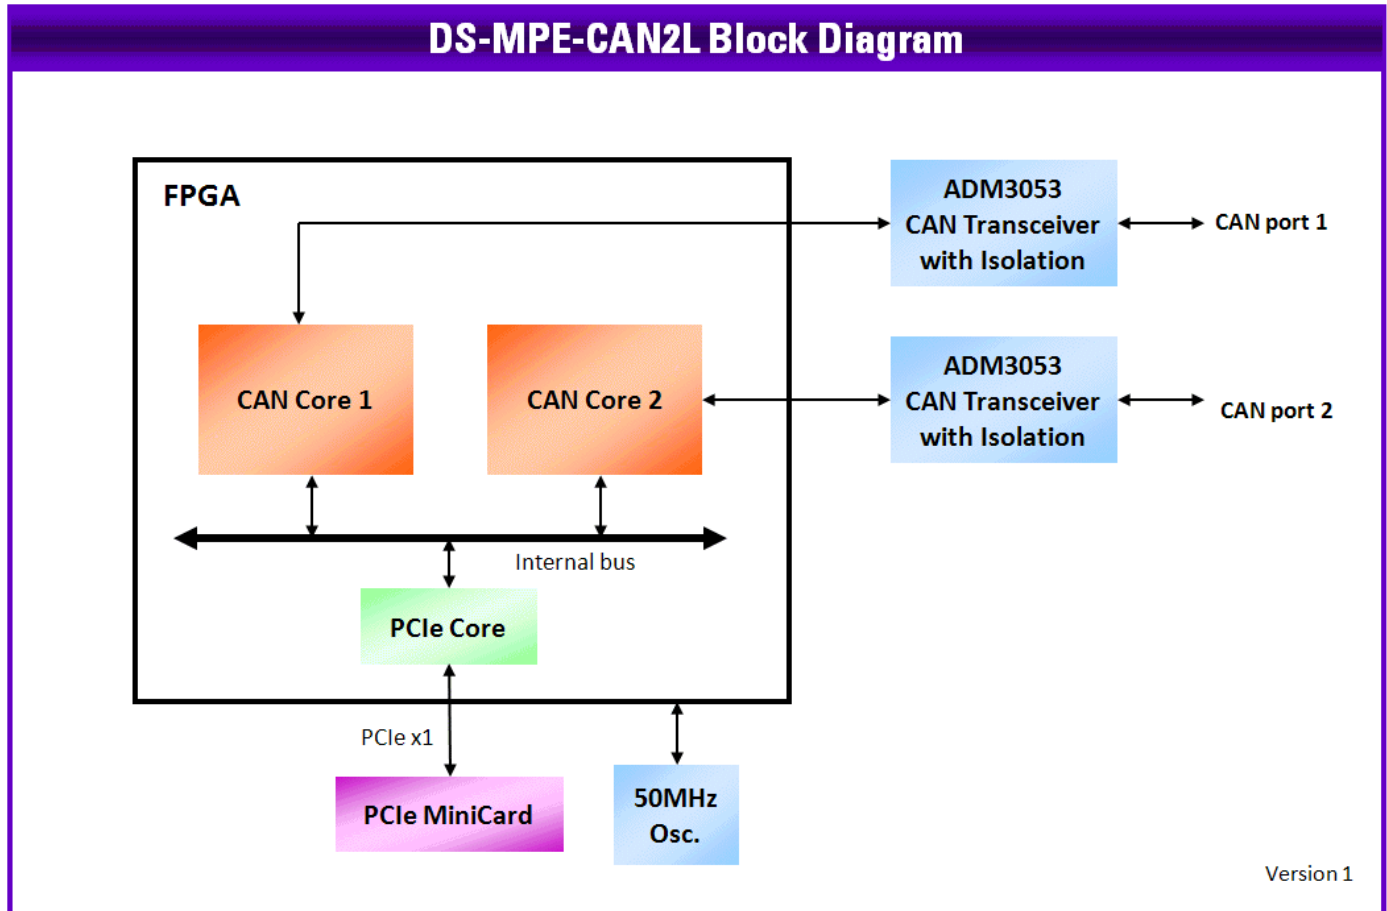

Quantity	Part Number	Description
1	9150500	DS-MPE-CAN2L hardware assembly
1	6800500	Hardware Kit with jumpers and screws
1	CK-CAN2L	Cable Kit with two CAN cables

4. FUNCTIONAL OVERVIEW

4.1 Functional Block Diagram

The DS-MPE-CAN2L block diagram is shown below.

4.2 Mechanical Board Drawing

The DS-MPE-CAN2L conforms to the PCIe MiniCard electromechanical specification revision 1.2, full size format. Overall dimensions are 50.95mm L x 30.00mm W.

The two mounting holes are isolated from the CPU ground and not connected to any ground lines.

4.3 CAN Controllers

The module offers two CAN controllers implemented as FPGA cores inside a Xilinx Spartan 6 FPGA. The core provides the following key features:

- Conforms to the ISO 11898 -1, CAN 2.0A, and CAN 2.0B standards
- Supports both standard (11-bit identifier) and extended (29-bit identifier) frames
- Supports bit rates up to 1Mbps
- Transmit message FIFO with a user-configurable depth of up to 64 messages
- Transmit prioritization through one High-Priority Transmit buffer
- Automatic re-transmission on errors or arbitration loss
- Receive message FIFO with a user-configurable depth of up to 64 messages
- Acceptance filtering with a user-configurable number of up to 16 acceptance filters
- Sleep Mode with automatic wake-up
- Loop Back Mode for diagnostic applications
- Maskable Error and Status Interrupts
- Readable Error Counters

4.4 Transceivers

The transceivers are Analog Devices ADM3053 combination isolation and transceiver. It provides isolated +5V to power the isolated side of the transceiver. This isolated +5V is available on the I/O connector.

4.5 Isolation

The module supports 500V isolation between each CAN port and the host, and between each CAN port and the other, via the ADM3053 isolated transceiver. An optional high-voltage resistor can be installed across each isolation barrier to enable leakage current flow between the isolated transceiver grounds and the host ground.

4.6 Power Supply

The module is powered by +3.3V from the PCIe MiniCard socket. It provides all other required voltages on board, including +5V for the CAN transceivers and the FPGA core voltages.

5. INSTALLATION

The DS-MPE-CAN2L plugs in to any socket meeting the PCIe MiniCard specifications. It has two connectors, one for each pair of serial ports, a protocol configuration jumper block, and a pair of mounting holes. To install the DS-MPE-CAN2L, fully insert the board into a PCIe MiniCard connector and secure in place by inserting one screw from the hardware kit into each of the mounting holes, see the diagram below.

6. CONNECTOR PINOUT AND PIN DESCRIPTION

6.1 PCIe MiniCard Edge Connector (J1)

The DS-MPE-CAN2L module is compatible with the standard Mini PCIe socket pinout as shown below.

WAKE#	1	2	+3.3VAUX_3
COEX1	3	4	GND9
COEX2	5	6	+1.5V_1
CLKREQ#	7	8	UIM_PWR
GND1	9	10	UIM_DATA
REFCLK-	11	12	UIM_CLK
REFCLK+	13	14	UIM_RESET
GND2	15	16	UIM_VPP
KEY			
RSVD(UIM_C8)	17	18	GND10
RSVD(UIM_C4)	19	20	W_DISABLE#
GND3	21	22	PERST#
PERN0	23	24	+3.3VAUX_4
PERP0	25	26	GND11
GND4	27	28	+1.5V_2
GND5	29	30	SMB_CLK
PETN0	31	32	SMB_DATA
PETP0	33	34	GND12
GND6	35	36	USB_D-
GND7	37	38	USB_D+
+3.3VAUX_1	39	40	GND13
+3.3VAUX_2	41	42	LED_WWAN#
GND8	43	44	LED_WLAN#
RSVD1	45	46	LED_WPAN#
RSVD2	47	48	+1.5V_3
RSVD3	49	50	GND14
RSVD4	51	52	+3.3VAUX_5

6.2 CAN Ports (J4, J7)

Each of the two CAN ports has its own 4-pin latching connector with the following pin out.

1	Ground Iso
2	CAN L
3	CAN H
4	Ground Iso

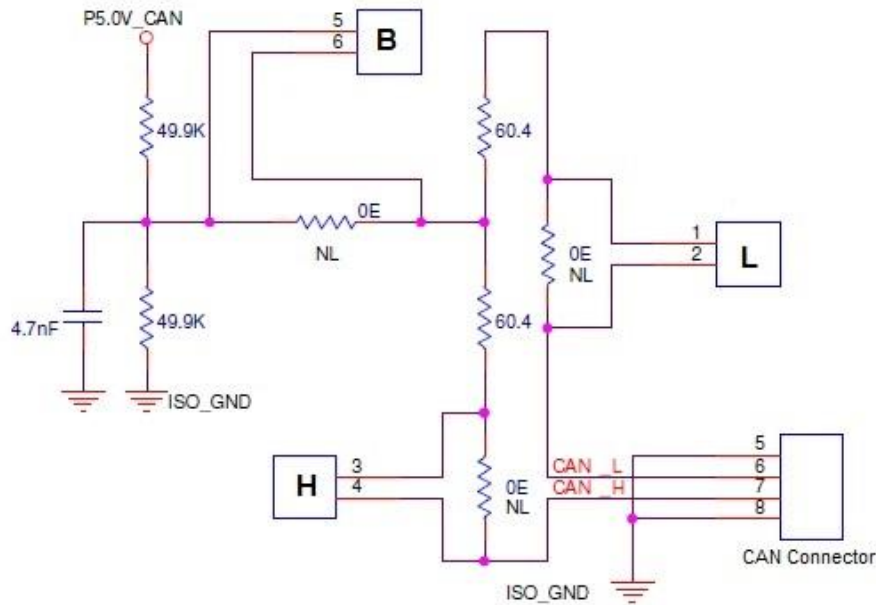

Connector Part Number / Description

BM04B-GHS-TBT 4 pos, 1.25mm, vertical, latching, SMD

7. JUMPER CONFIGURATION

The DS-MPE-CAN2L module has two line termination jumper blocks, one for each port. Jumper block J3 is for port J4, and jumper block J6 is for port J7. Jumper blocks J3 and J6 are identical. The default is no jumpers installed. To add termination for a port's bias line (jumper position B), CAN-H line (jumper position H), or CAN-L line (jumper position L), add a jumper at B, H or L location respectively.

B	H	L
○	○	○
○	○	○

8. LINUX DRIVER INSTALLATION

8.1 Installing the Software

The following steps are used to install the CAN interface utility software under the Linux operating system.

Step-1:

Download the DSC_CAN2L_PCI_LINUX_V1.7.zip file from the DS-MPE-CAN2L webpage (<http://www.diamondsystems.com/products/dsmpecan2l>). Click on *Linux driver package v1.0.7* in the Downloads section of the webpage. Use the following command to unzip the files:

```
Unzip DSC_CAN2L_PCI_LINUX_V1.7.zip
```

A DSC_CAN2L_PCI_LINUX_V1.7 directory will be created where the zip file is extracted. The DSC_CAN2L_PCI_LINUX_V1.7 directory contains the following files.

```
ls -l
1. CAN_Monitor : CAN Monitor demo application directory
2. CANLib : CAN Linux shared library.
3. dsc_can2_pci_driver: Linux CAN driver.
4. qt-opensource-linux-x86-5.2.1.run : Qt Installer which is required by the PCI CAN Interface utility.
```

Step-2:

Install the Qt shared libraries using the Qt Installer. Execute the command below and follow the Qt Installer instructions. Use the command below to install the Qt shared libraries. Install Qt at the default locations.

```
cd DSC_CAN2L_PCI_LINUX_V1.7
./qt-opensource-linux-x86-5.2.1.run
```

Note: The Qt shared libraries should be installed only once.

Step-3:

PCI CAN Utility is based on the CANLib library. Copy the shared library to “/lib” directory.

```
cd CANLib
cp libCAN.so /lib
```

Please note : Step-3 should be done only once.

Step-4:

Load the PCI CAN interface driver using the command below from the dsc_can2_pci_driver directory where the zip file is extracted.

```
cd dsc_can2_pci_driver
insmod dsc_can2_pci.ko
```

Step-5:

Start the PCI CAN Utility using the command below from the CAN_Monitor directory where the zip file is extracted.

```
cd CAN_monitor
./CAN
```

This command will open the CAN interface utility. To start the CAN utility in the future, follow Steps 4 and 5 only.

8.2 Setting the Baud Rate

Using the CAN interface utility software, the baud rate for each port can be selected. On the desired CAN port, select the baud rate from the Baud Rate drop-down menu. After selecting the desired baud rate, press **“Connect”** to connect with specified baud rate as shown in below figure.

The screenshot shows the CAN Monitor software interface with the following components:

- Connection CAN1:** Baud Rate: 500kbps, Msg Type: Standard, Connect button (highlighted with a red box and arrow), Disconnected! status.
- Write Message:** ID: 0000, Len: 8, Data(Hex): 00 00 00 00 00 00 00 00, Add List, Clear List, Write Message buttons.
- CAN#1 Messages:** Table with columns: Time, CanID, Len, Data. Save Log, Clear Log buttons.
- Connection CAN2:** Baud Rate: 500kbps, Msg Type: Standard, Connect button, Disconnected! status.
- Write Message:** ID: 00000000, Len: 8, Data(Hex): 00 00 00 00 00 00 00 00, Add List, Clear List, Write Message buttons.
- CAN#2 Messages:** Table with columns: Time, CanID, Len, Data. Save Log, Clear Log buttons.
- Footer:** DIAMOND SYSTEMS logo, CAN Monitor © 2014 Diamond Systems Corp. www.diamondsystems.com, Software Version :1.0.4

To change the baud rate, click on **“Disconnect”** and select a new baud rate.

8.3 Setting the CAN ID and Message Length

Set the CAN ID and CAN message length for each CAN port by entering the desired numbers into the ID and Len fields respectively for that port.

The screenshot shows the CAN Monitor software interface with the following components:

- File Menu:** File, CAN1, CAN2
- Connection CAN1:**
 - Baud Rate: 500kbps
 - Msg Type: Standard
 - Status: Connected!
 - Disconnect button
- Write Message (CAN1):**
 - ID: 12 (labeled as CAN ID)
 - Len: 8 (labeled as Message Length)
 - Data(Hex) input fields: 1, 2, 3, 4, 5, 6, 7, 8
 - Buttons: Add List, Clear List, Write Message
- CAN#1 Messages:**
 - Table with columns: Time, CanID, Len, Data
 - Save Log, Clear Log buttons
- Connection CAN2:**
 - Baud Rate: 500kbps
 - Msg Type: Standard
 - Status: Disconnected!
 - Connect button
- Write Message (CAN2):**
 - ID: 00000000
 - Len: 8
 - Data(Hex) input fields: 00, 00, 00, 00, 00, 00, 00, 00
 - Buttons: Add List, Clear List, Write Message
- CAN#2 Messages:**
 - Table with columns: Time, CanID, Len, Data
 - Save Log, Clear Log buttons
- Footer:**
 - DIAMOND SYSTEMS logo
 - CAN Monitor© 2014 Diamond Systems Corp. www.diamondsystems.com
 - Software Version :1.0.4

8.4 Writing a Message

To write a message on a CAN port, define the CAN message by entering the desired data into the Data (Hex) fields. Then click on **“Write Message”** as shown in the below figure.

The screenshot displays the CAN Monitor software interface. The top menu bar includes 'File', 'CAN1', and 'CAN2'. The main window is divided into two sections: 'CAN#1 Messages' and 'CAN#2 Messages'.

CAN#1 Messages Section:

- Connection CAN1:** Baud Rate is set to 500kbps, Msg Type is Standard, and the status is 'Connected!'. A 'Disconnect' button is visible.
- Write Message:** ID is 12, Len is 8. The Data (Hex) field contains eight slots numbered 1 through 8, each with a corresponding hex digit (1, 2, 3, 4, 5, 6, 7, 8). A red box highlights these slots, and a red arrow points to them with the label 'CAN Messages'. Below the Data (Hex) field are 'Add List', 'Clear List', and 'Write Message' buttons. The 'Write Message' button is circled in red, and a red arrow points to it with the text 'Click on write message to transmit'.
- CAN#1 Messages Table:** Shows a single message with Time, CanID (12), Len (8), and Data (1 2 3 4 5 6 7 8).
- Buttons:** 'Save Log' and 'Clear Log' buttons are located at the bottom right of the CAN#1 Messages section.

CAN#2 Messages Section:

- Connection CAN2:** Baud Rate is set to 500kbps, Msg Type is Standard, and the status is 'Disconnected!'. A 'Connect' button is visible.
- Write Message:** ID is 00000000, Len is 8. The Data (Hex) field contains eight slots, each with '00'. Below the Data (Hex) field are 'Add List', 'Clear List', and 'Write Message' buttons.
- CAN#2 Messages Table:** Currently empty.
- Buttons:** 'Save Log' and 'Clear Log' buttons are located at the bottom right of the CAN#2 Messages section.

The footer of the software includes the Diamond Systems logo, the text 'CAN Monitor © 2014 Diamond Systems Corp. www.diamondsystems.com', and 'Software Version :1.0.4'.

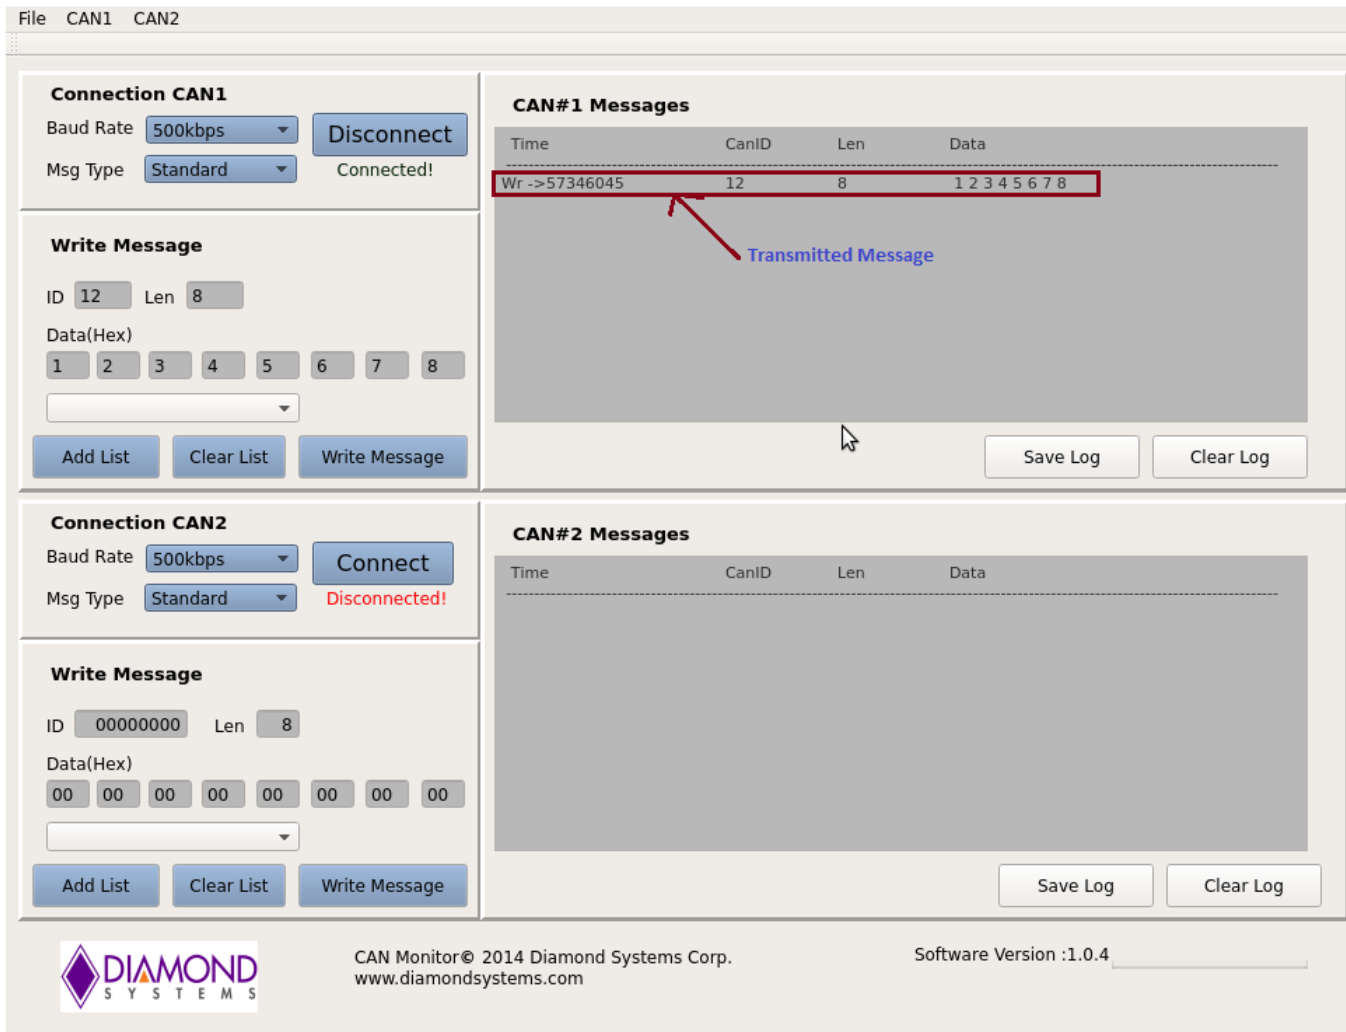

To transmit to a different CAN ID, change the data in the CAN ID field, enter the desired data into the Data (Hex) fields, and click on **“Write Message”**.

To change the message length, change the CAN message length to the new length, enter the desired data into the Data (Hex) fields, and click on **“Write Message”**.

To transmit a different CAN message to the same CAN ID, change the CAN message to the desired data, and click on **“Write Message”**.

8.5 Viewing Messages

Transmitted messages are listed in the CAN message box for the sending CAN port as shown in below figure.

The screenshot displays the CAN Monitor software interface with the following components:

- File CAN1 CAN2** (Menu bar)
- Connection CAN1**
 - Baud Rate: 500kbps
 - Msg Type: Standard
 - Status: Connected!
 - Buttons: Disconnect
- Write Message**
 - ID: 12, Len: 8
 - Data(Hex): 1 2 3 4 5 6 7 8
 - Buttons: Add List, Clear List, Write Message
- CAN#1 Messages**

Time	CanID	Len	Data
Wr ->57346045	12	8	1 2 3 4 5 6 7 8

A red box highlights the message row, and a red arrow points to it with the label "Transmitted Message".
- Connection CAN2**
 - Baud Rate: 500kbps
 - Msg Type: Standard
 - Status: Disconnected!
 - Buttons: Connect
- Write Message**
 - ID: 00000000, Len: 8
 - Data(Hex): 00 00 00 00 00 00 00 00
 - Buttons: Add List, Clear List, Write Message
- CAN#2 Messages**

Software Version :1.0.4 _____

9. CONFIGURE AND MANAGE THE PORTS IN LINUX

The CANLib library provides the set of APIs to configure and manage the CAN ports. The CANLib library can be used to build the CAN user application. It is a shared library built on top of Linux platform and using the driver provided functionality. To compile the CANLib shared library, use the below command

```
cd CANLib
make
```

All the CAN APIs prototypes are defined in the can.h file. This file is located in the CANLib directory. Include the can.h file in the user application to use all these APIs.

9.1 API to Configure and Manage CAN Ports

init_can0() & **init_can1()** : These function will initialize the CAN#0 & CAN#1 ports respectively.

Both these functions return the CAN file descriptor (fd). The return value of these functions should be retained for all subsequent APIs. Its prototypes are defined in the can.h file. Declare two CAN file descriptors and retains its return values.

```
#include "can.h"
...
int  can0_fd;
int  can1_fd;
...
can0_fd = init_can0() ;
if ( can0_fd < 0 )
{
    printf("Error while initializing the CAN#0\n") ;
    exit(0) ;
}
...
can1_fd = init_can1() ;
if ( can1_fd < 0 )
{
    printf("Error while initializing the CAN#1\n") ;
    exit(0) ;
}
```

Baud Rate Configuration

set_baudrate() : This function configures the baud rate for the specified CAN port. By default it will not configure any baud rate. Below code snippet describes the usage of setting baud rate to 500kbps.

```
// Set 500k Baud rate for CAN#0
ret_val = set_baudrate(can0_fd, CAN_SPEED_500K ) ;
if ( ret_val < 0 )
{
    printf("Error while setting the baud rate \n") ;
    exit(0) ;
}
// Set 500k Baud rate for CAN#1
ret_val = set_baudrate(can1_fd, CAN_SPEED_500K ) ;
if ( ret_val < 0 )
{
    printf("Error while setting the baud rate \n") ;
    exit(0) ;
}
```

In the above code, *can0_fd* and *can1_fd* should contain the values returned by *init_can0* and *init_can1* function.

Use below macros for setting the different baud rates. These macros can also be found in *can.h* file.

```
CAN_SPEED_1M
CAN_SPEED_800K
CAN_SPEED_500K
CAN_SPEED_250K
CAN_SPEED_125K
CAN_SPEED_100K
CAN_SPEED_50K
CAN_SPEED_20K
CAN_SPEED_10K
```

CAN Transmit & Receive

can_tx() & can_rx() : These functions are be used to Transmit and Receive the CAN messages respectively.

CAN Transmit Prototype

```
int can_tx( int can_fd, unsigned char  msgType, unsigned int can_id, int
len, unsigned char *data) ;
```

Assign the appropriate values, before calling the can_tx function.

```
can0_fd: CAN descriptor, return value from init_can0() function
msgType = MSG_STANDARD ; // or MSG_EXTENDED.
can_id = 0x12;
//if the msgType is MSG_STANDARD then can_id value should be in the range of 0x0 to 0x7FF (11 bit value)
//Else if the msgType is MSG_EXTENDED then can_id value should be in the range 0x0 to 0x1FFFFFFF (29 bit value)

len = 4 //This field can be of 0 to 8 ; // CAN Transmit Data Length (DLC)
data: This field depends on the above CAN Data length len field.
In this case, len is 4 then the CAN message data will be of 4 bytes long and each
byte can have values from 0x0 to 0xFF (8-bits )
    data[0] = 0x1A ;
    data[1] = 0xAB ;
    data[2] = 0x22 ;
    data[3] = 0x4D ;

ret_val = can_tx(can0_fd, msgType, can_id, dlc, data) ;
if ( ret_val < 0 )
{
    printf("Error while transmitting the CAN message.\n") ;
    close(can1_fd) ;
    exit(0) ;
}
```

The above sample code will transmit the CAN standard message with CAN ID=0x12 of data length=4 and message data = {0x1A, 0xAB, 0x22, 0x4D};

CAN Receive Prototype

```
int can_rx(int can_fd, unsigned char *msgType, unsigned char *rx_data, unsigned int *can_id, unsigned char *can_msg_len) ;
```

Pass the appropriate pointers for calling the can_rx function:

```
if ( can_rx(can0_fd, &msgType, data, &can_id, &dlc) )
{
    If (msgType == MSG_STANDARD )
    {
        // Received message is CAN Standard Message.
    }
    else if (msgType == MSG_EXTENDED)
    {
        // Received message is CAN Extended Message.
    }
    // dlc : Received CAN Data Length
    // can_id : Will contain the CAN Message ID
    // Data of dlc length
    printf("ID=%x DLC=%d Data : ", can_id, dlc) ;
    for (i=0; i< dlc; i++ )
        printf("%x ", data[i] ) ;
    printf("\n") ;
}
```

The sample example programs for both transmit and receive can be found in the CANLib directory for the reference.

9.2 Compiling User Application using CANLib Library

Export the library path using the following command:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/path-to-CANLib
```

To compile the user application, use the following command:

```
g++ can_app.c -lCAN -L/path-to-CANLib -o can_app
```

10. DRIVER INSTALLATION AND DEMO APPLICATION FOR WINDOWS

Download the DSC_CAN2_PCI_WIN_V1.0.3.zip file from the DS-MPE-CAN2L webpage (<http://www.diamondsystems.com/products/dsmpecan2l>). Click on *Windows driver package v1.0.3* in the Downloads section of the webpage. Use the following command to unzip the files:

```
Unzip DSC_CAN2L_PCI_WIN_V1.0.3.zip
```

The “DSC_CAN2_PCI_WIN_V1.0.3” directory contains the CAN application, library, and driver for testing the 2-CAN interfaces.

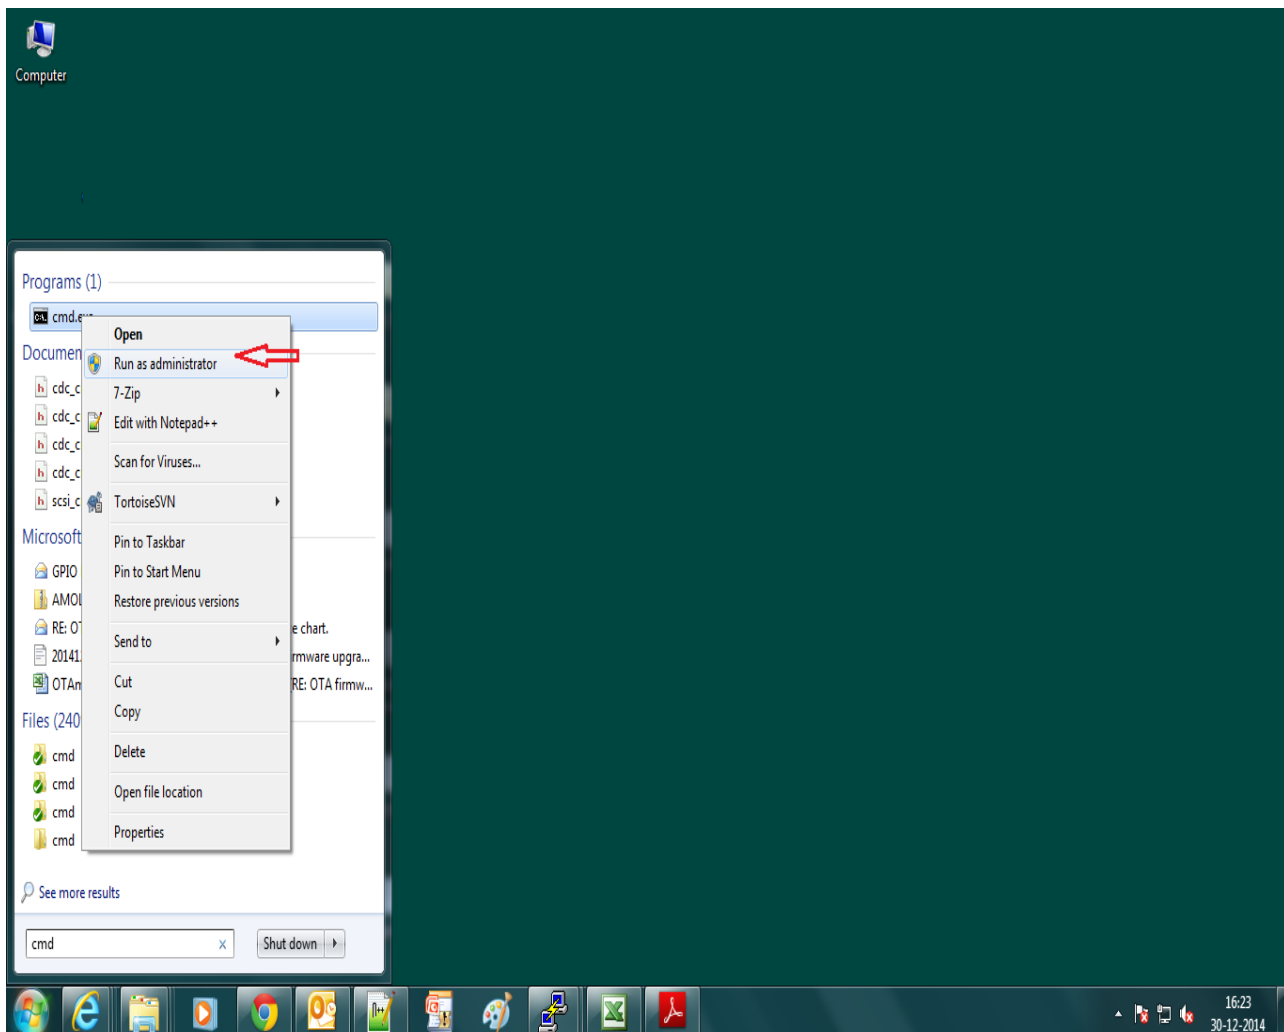

1. App : CAN Monitor demo application directory
2. dsc_can2_pci_src: Demo application source code directory.
3. dsc_can2_pci_driver: Windows CAN driver

10.1 Installing the PCI-CAN Driver

Step-1:

Open Windows command prompt with Administrator privileges.

Click on Windows start button and type cmd in the search box and right click on the cmd.exe and click on “Run as administrator”. Please refer to the screenshot given below.

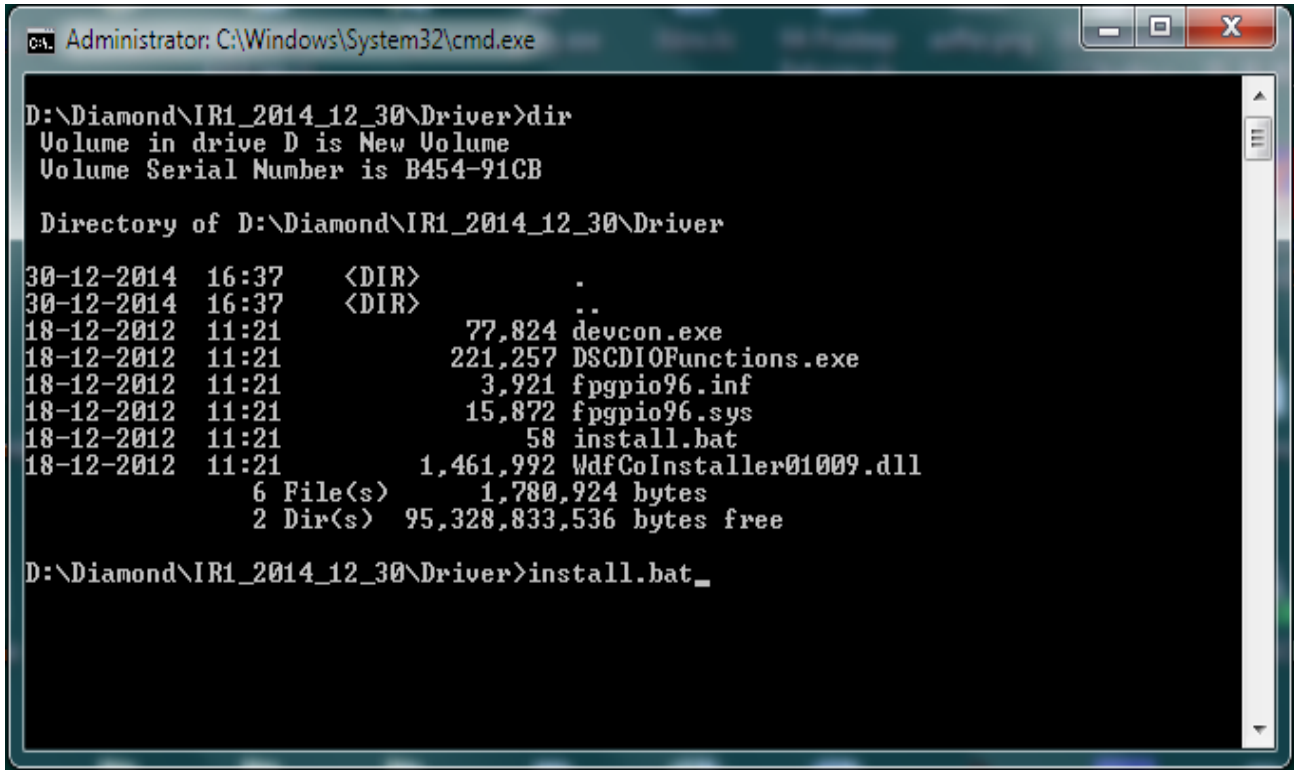

Step-2:

Change the working directory from the command prompt to the “DSC_CAN2_PCI_WIN_V1.0.3\dsc_can2_pci_driver” directory where the software is copied.

Step-3:

Execute “install.bat”. Please see the below screenshot for details. After executing, follow the next steps to install the driver.

```

Administrator: C:\Windows\System32\cmd.exe
D:\Diamond\IR1_2014_12_30\Driver>dir
Volume in drive D is New Volume
Volume Serial Number is B454-91CB

Directory of D:\Diamond\IR1_2014_12_30\Driver

30-12-2014  16:37    <DIR>          .
30-12-2014  16:37    <DIR>          ..
18-12-2012  11:21                77,824 devcon.exe
18-12-2012  11:21            221,257 DSCDIOFunctions.exe
18-12-2012  11:21                3,921 fpgpio96.inf
18-12-2012  11:21            15,872 fpgpio96.sys
18-12-2012  11:21                 58 install.bat
18-12-2012  11:21    1,461,992 WdfCoInstaller01009.dll
           6 File(s)      1,780,924 bytes
           2 Dir(s)   95,328,833,536 bytes free

D:\Diamond\IR1_2014_12_30\Driver>install.bat_
  
```

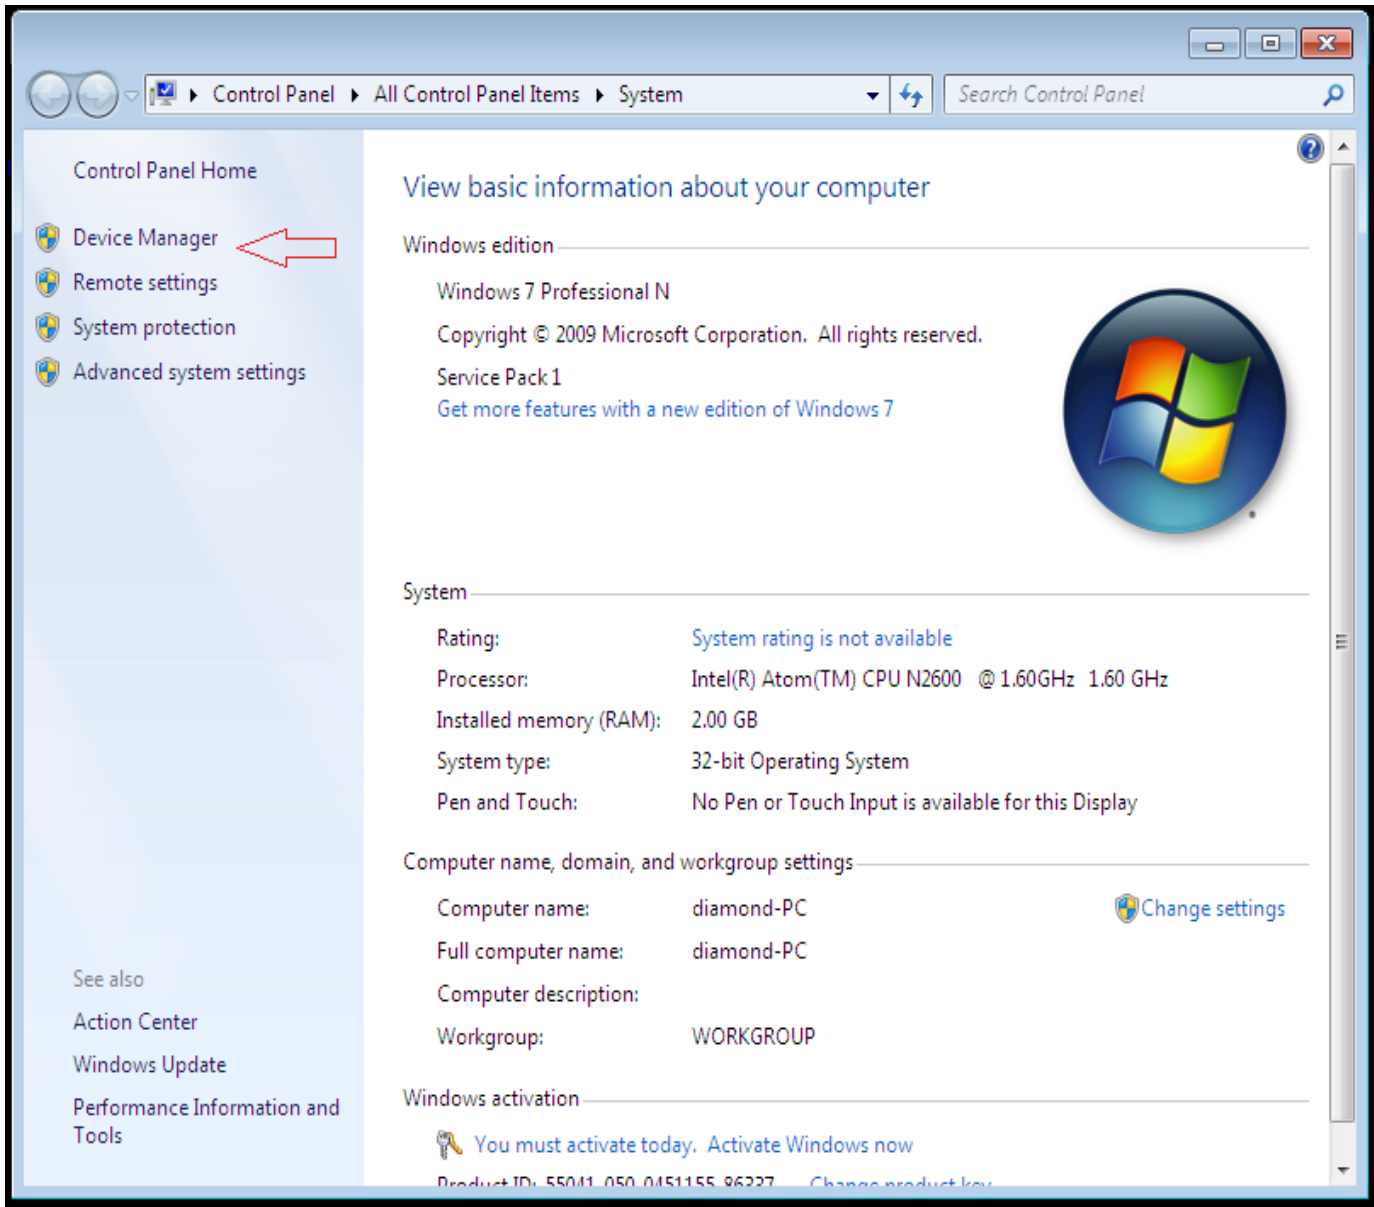

Step-4:

Restart the system.

Step-5:

Check whether the driver is installed properly or not by opening the device manager.

Right Click on My Computer => Click on Properties => Device Manager. Please refer to the screenshot below.

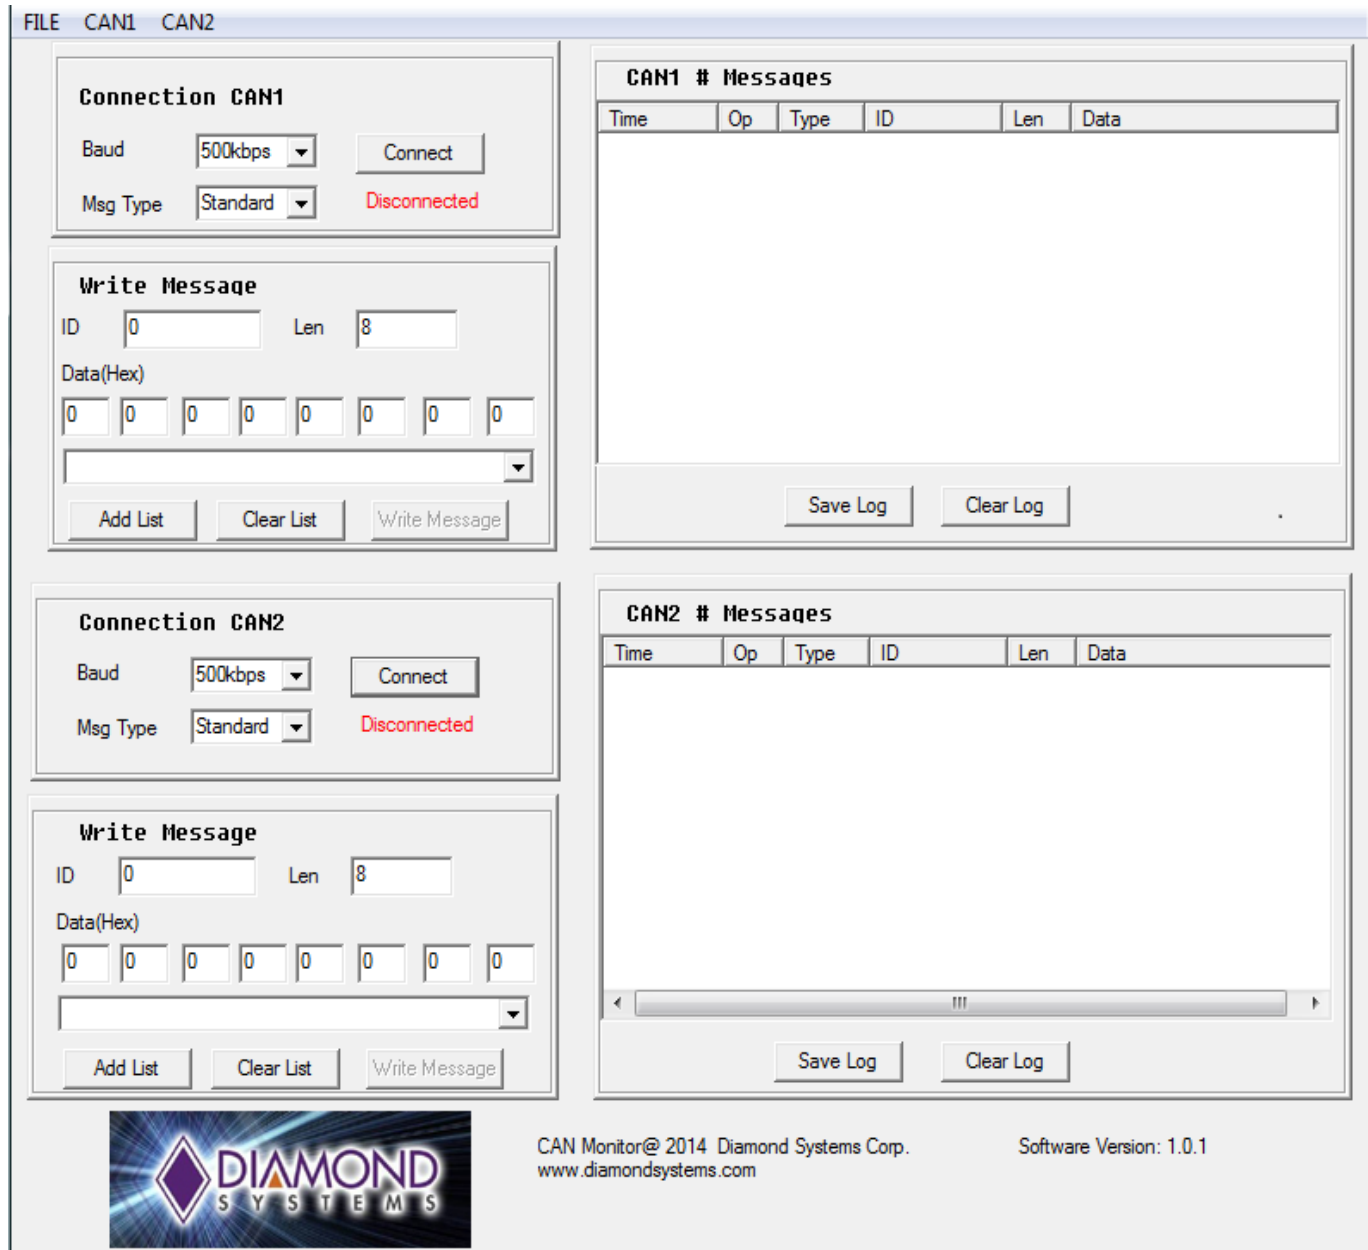

If the driver is installed properly then the device manager will show the device as “**PCIe Sample device**” under “**Sample Device**” as shown in the screenshot below.

10.2 Run the Windows Application

The application is stored in the “App” directory. Double click on “dsc_can2_pci.exe”. The application window will open as shown in the below screenshot.

The screenshot displays the CAN Monitor application interface, which is divided into several sections for configuring and monitoring CAN buses.

Connection CAN1: Baud rate is set to 500kbps, Message Type is Standard, and the status is Disconnected. A Connect button is available.

Write Message (CAN1): ID is 0, Length is 8. Data (Hex) is 0 0 0 0 0 0 0 0. Buttons for Add List, Clear List, and Write Message are present.

Connection CAN2: Baud rate is set to 500kbps, Message Type is Standard, and the status is Disconnected. A Connect button is available.

Write Message (CAN2): ID is 0, Length is 8. Data (Hex) is 0 0 0 0 0 0 0 0. Buttons for Add List, Clear List, and Write Message are present.

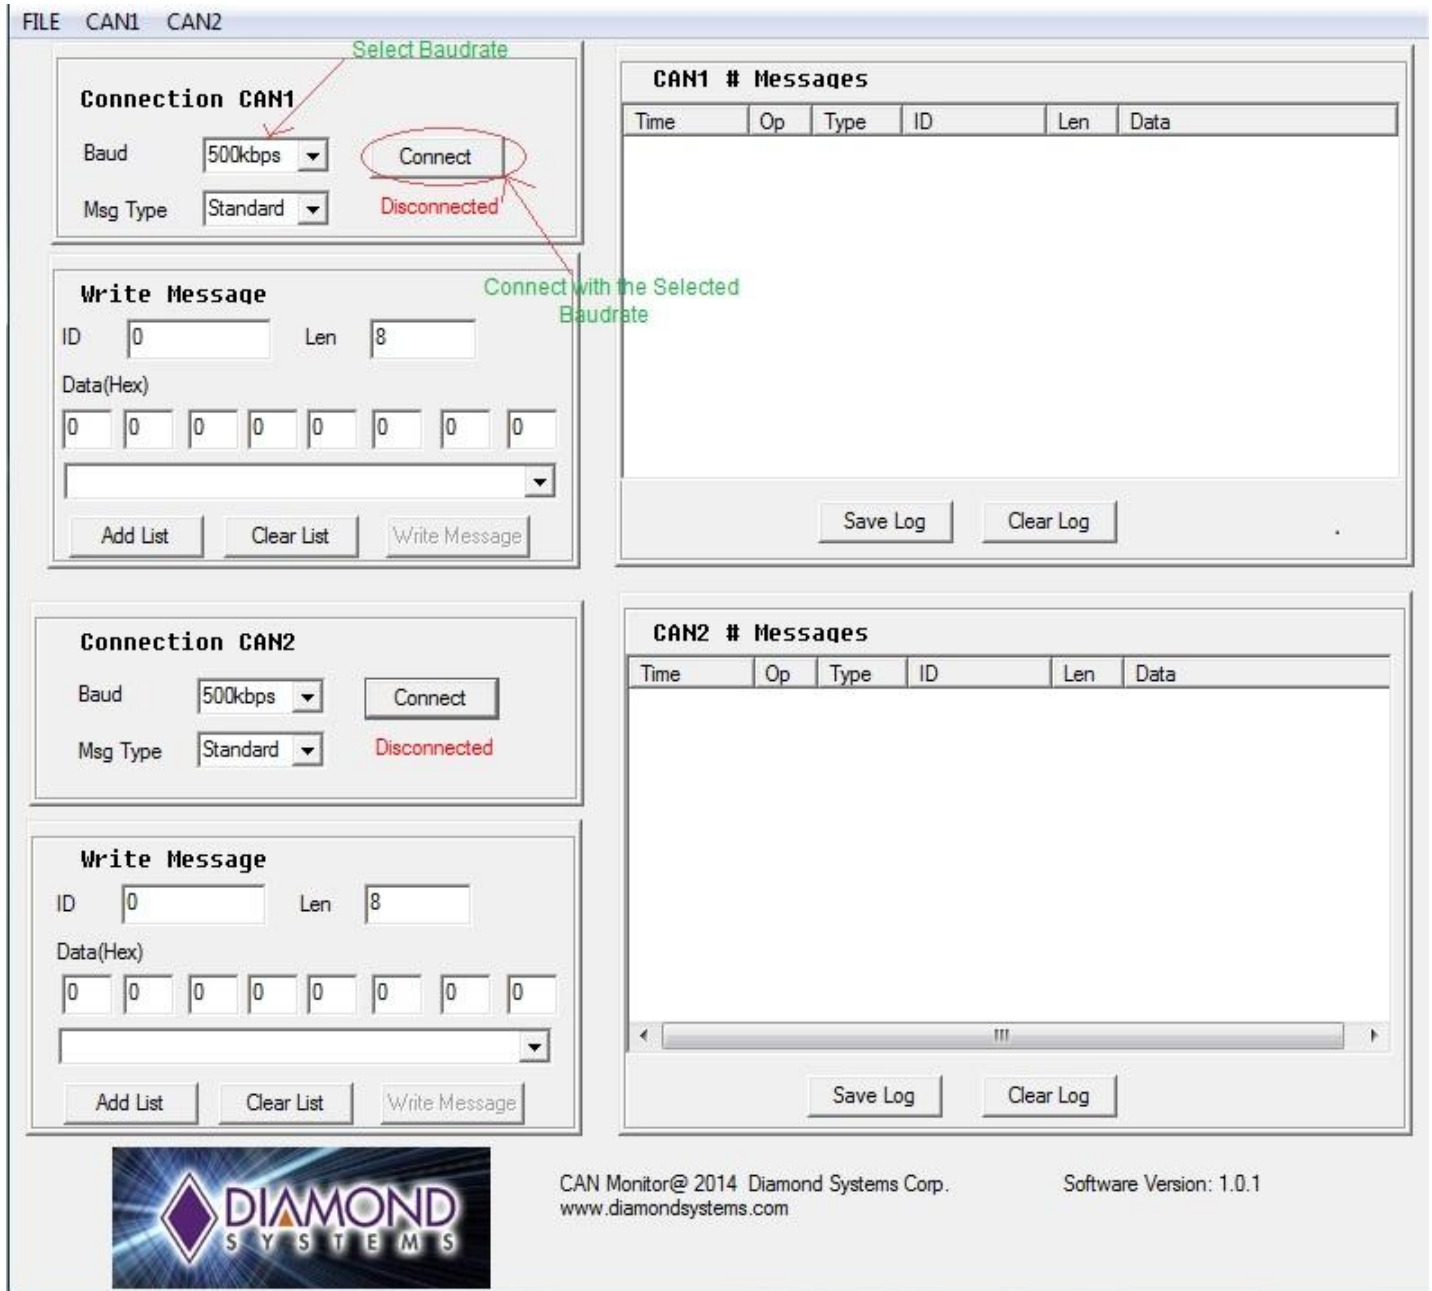

CAN1 # Messages: A table with columns Time, Op, Type, ID, Len, and Data. Below the table are Save Log and Clear Log buttons.

CAN2 # Messages: A table with columns Time, Op, Type, ID, Len, and Data. Below the table are Save Log and Clear Log buttons.

Footer: Includes the Diamond Systems logo, copyright information (CAN Monitor© 2014 Diamond Systems Corp. www.diamondsystems.com), and Software Version: 1.0.1.

10.3 Setting the Baud Rate

Using the CAN interface utility software, the baud rate for each port can be selected. On the desired CAN port, select the baud rate from the Baud Rate drop-down menu. After selecting the desired baud rate, press **“Connect”** to connect with specified baud rate as shown in below figure.

The screenshot displays the CAN Monitor software interface with the following components:

- Menu Bar:** FILE, CAN1, CAN2
- Connection CAN1:**
 - Baud: 500kbps (dropdown menu)
 - Msg Type: Standard (dropdown menu)
 - Connect button (circled in red)
 - Disconnected status indicator
- Write Message (CAN1):**
 - ID: 0, Len: 8
 - Data(Hex): 0 0 0 0 0 0 0 0
 - Buttons: Add List, Clear List, Write Message
- Connection CAN2:**
 - Baud: 500kbps (dropdown menu)
 - Msg Type: Standard (dropdown menu)
 - Connect button
 - Disconnected status indicator
- Write Message (CAN2):**
 - ID: 0, Len: 8
 - Data(Hex): 0 0 0 0 0 0 0 0
 - Buttons: Add List, Clear List, Write Message
- CAN1 # Messages:**

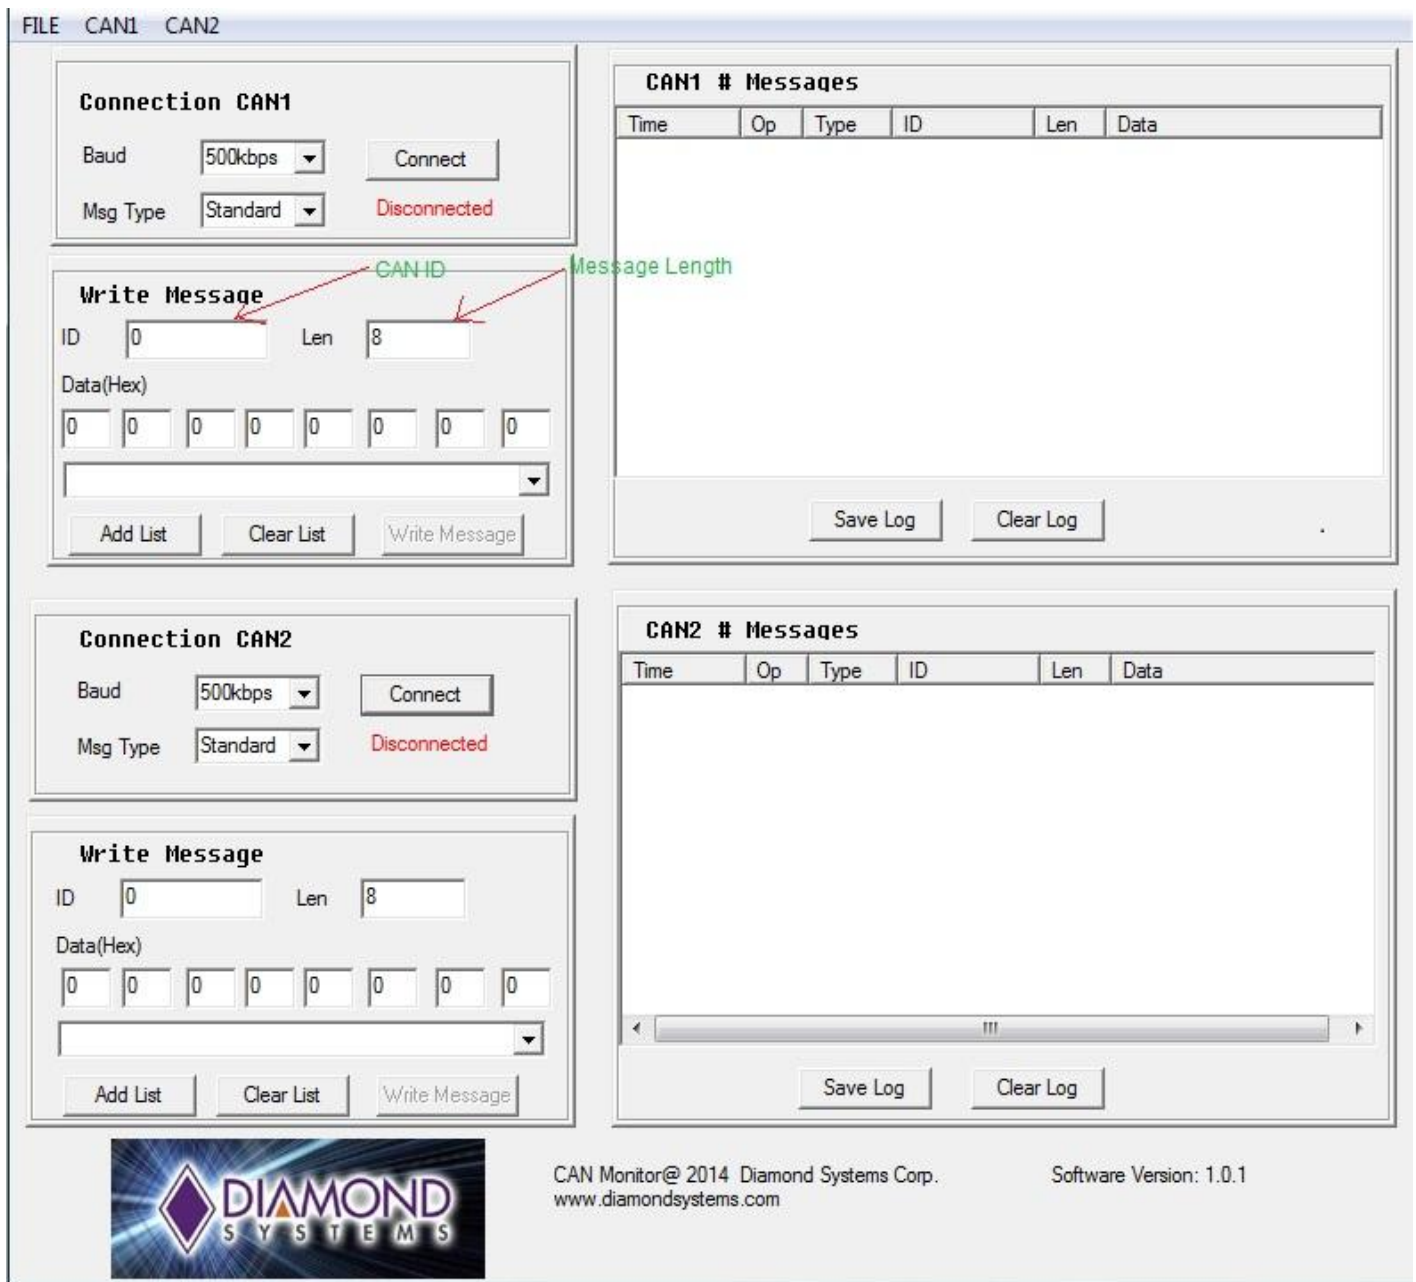

Time	Op	Type	ID	Len	Data
- CAN2 # Messages:**

Time	Op	Type	ID	Len	Data
- Footer:**
 - DIAMOND SYSTEMS logo
 - CAN Monitor@ 2014 Diamond Systems Corp. www.diamondsystems.com
 - Software Version: 1.0.1

To change the baud rate, click on **“Disconnect”** and select a new baud rate.

10.4 Setting the CAN ID and Message Length

Set the CAN ID and CAN message length for each CAN port by entering the desired numbers into the ID and Len fields respectively for that port.

The screenshot displays the CAN Monitor software interface with the following components:

- Menu Bar:** FILE | CAN1 | CAN2
- Connection CAN1:**
 - Baud: 500kbps (dropdown)
 - Msg Type: Standard (dropdown)
 - Status: Disconnected
 - Connect button
- Write Message (CAN1):**
 - ID: 0 (input field)
 - Len: 8 (input field)
 - Data(Hex): 0 0 0 0 0 0 0 0 (input fields)
 - Buttons: Add List, Clear List, Write Message
- CAN1 # Messages:**

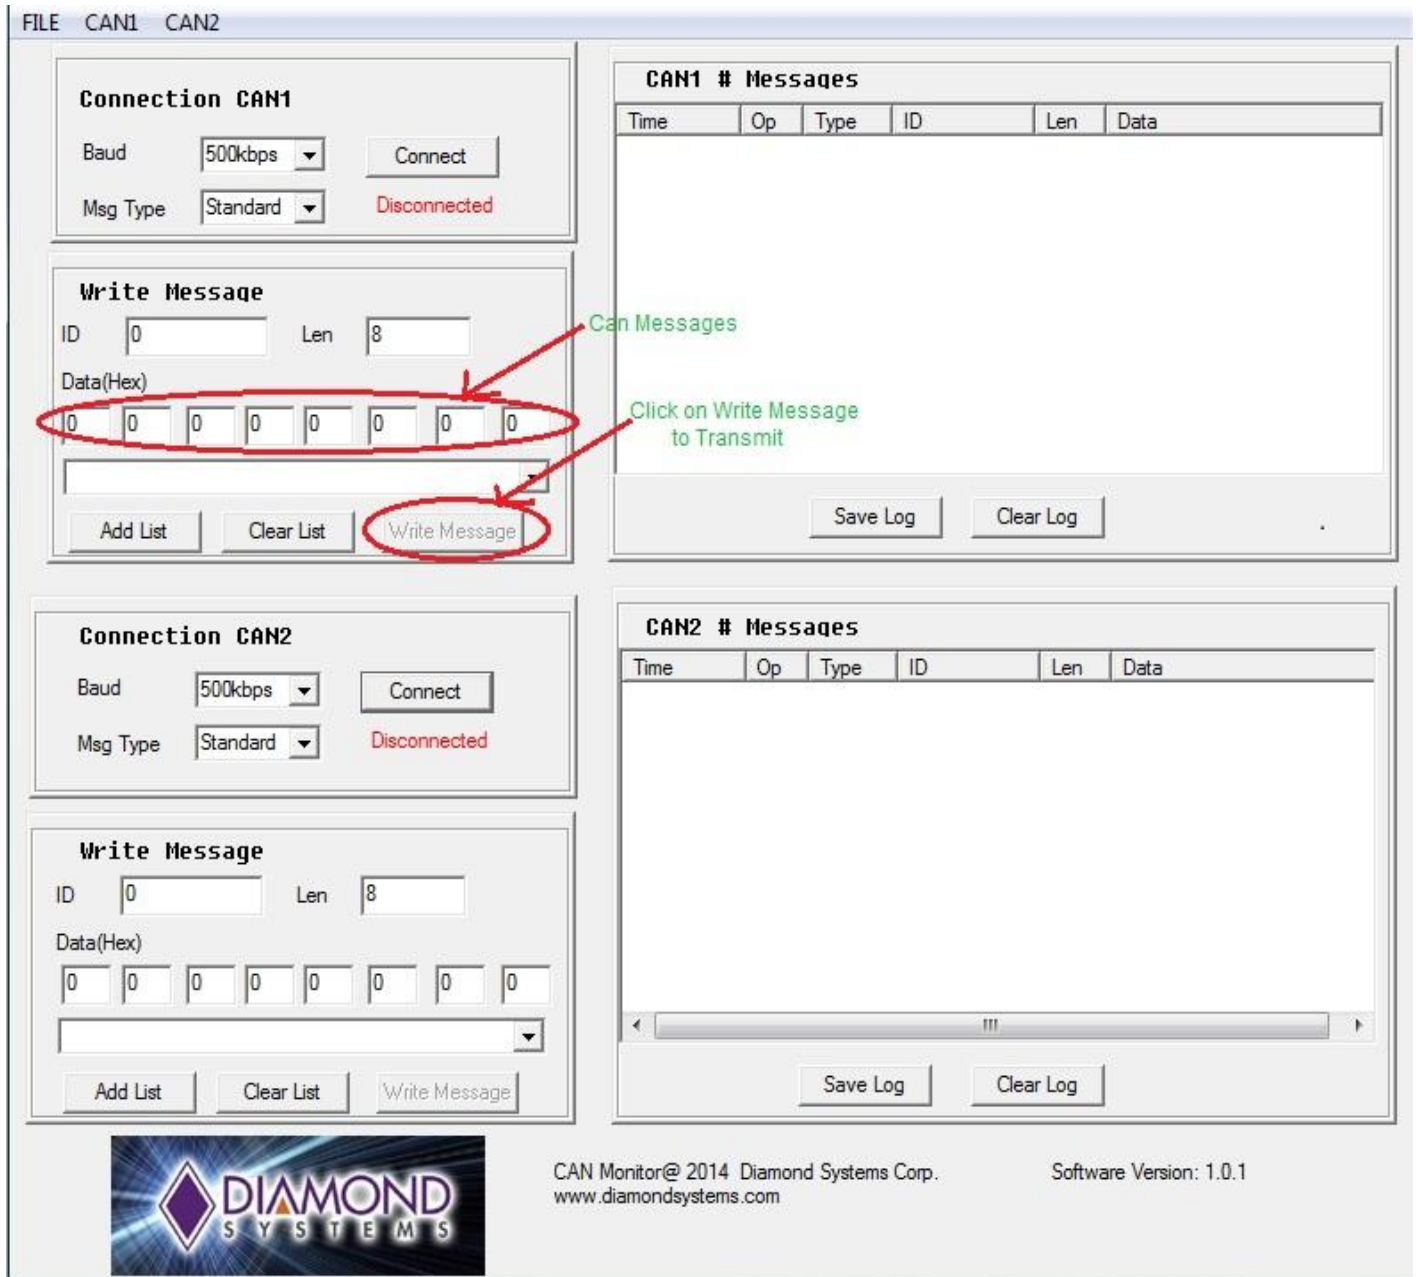

Time	Op	Type	ID	Len	Data
- Connection CAN2:**
 - Baud: 500kbps (dropdown)
 - Msg Type: Standard (dropdown)
 - Status: Disconnected
 - Connect button
- Write Message (CAN2):**
 - ID: 0 (input field)
 - Len: 8 (input field)
 - Data(Hex): 0 0 0 0 0 0 0 0 (input fields)
 - Buttons: Add List, Clear List, Write Message
- CAN2 # Messages:**

Time	Op	Type	ID	Len	Data
- Footer:**
 - DIAMOND SYSTEMS logo
 - CAN Monitor@ 2014 Diamond Systems Corp. www.diamondsystems.com
 - Software Version: 1.0.1

Red arrows in the image point from the text "CAN ID" to the ID input field and "Message Length" to the Len input field in the CAN1 Write Message section.

10.5 Writing a Message

To write a message on a CAN port, define the CAN message by entering the desired data into the Data (Hex) fields. Then click on **“Write Message”** as shown in the below figure.

The screenshot displays the CAN Monitor software interface. It features two main sections for CAN1 and CAN2, each with a 'Connection' and 'Write Message' panel. The 'Write Message' panels include fields for ID, Len, and Data (Hex). The Data (Hex) fields are highlighted with a red circle, and the 'Write Message' button is also circled in red. Green arrows point to the Data (Hex) fields with the text 'Can Messages' and 'Click on Write Message to Transmit'. The interface also includes message logs for CAN1 and CAN2, and a footer with the Diamond Systems logo, copyright information, and software version.

Connection CAN1
 Baud: 500kbps
 Msg Type: Standard
 Status: Disconnected

Write Message
 ID: 0
 Len: 8
 Data(Hex): 0 0 0 0 0 0 0 0
 Buttons: Add List, Clear List, Write Message

Connection CAN2
 Baud: 500kbps
 Msg Type: Standard
 Status: Disconnected

Write Message
 ID: 0
 Len: 8
 Data(Hex): 0 0 0 0 0 0 0 0
 Buttons: Add List, Clear List, Write Message

CAN1 # Messages
 Table with columns: Time, Op, Type, ID, Len, Data

CAN2 # Messages
 Table with columns: Time, Op, Type, ID, Len, Data

DIAMOND SYSTEMS
 CAN Monitor© 2014 Diamond Systems Corp.
 www.diamondsystems.com
 Software Version: 1.0.1

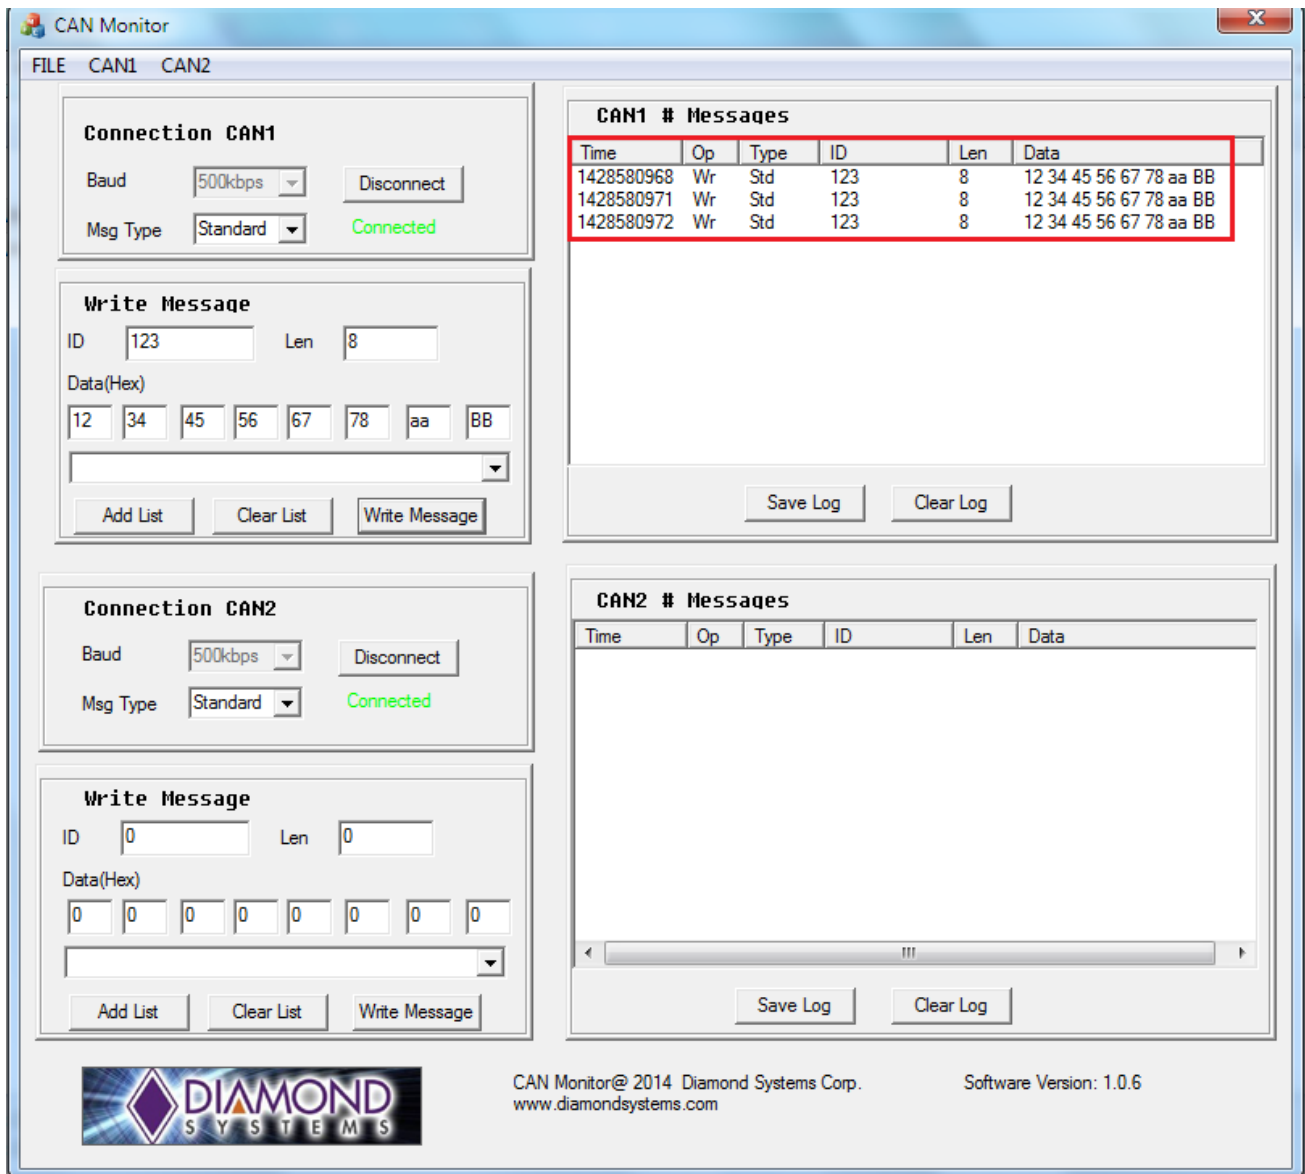

To transmit a different CAN ID, change data in the CAN ID field, enter the desired data into the Data (Hex) fields, and click on **“Write Message”**.

To change the message length, change the CAN message length to the new length, enter the desired data into the Data (Hex) fields, and click on **“Write Message”**.

To transmit a different CAN message to the same CAN ID, change the CAN message to the desired data, and click on **“Write Message”**.

10.6 Viewing Messages

Transmitted and received messages are listed in the CAN message box for the sending CAN port as shown in below figure.

The screenshot displays the CAN Monitor application window, which is divided into several sections for managing two CAN ports (CAN1 and CAN2).

Connection CAN1: Shows a baud rate of 500kbps and a message type of Standard. The status is 'Connected'.

Write Message (CAN1): The ID is set to 123 and the length is 8. The data field contains the hexadecimal values 12, 34, 45, 56, 67, 78, aa, and BB.

Connection CAN2: Shows a baud rate of 500kbps and a message type of Standard. The status is 'Connected'.

Write Message (CAN2): The ID is set to 0 and the length is 0. The data field contains eight 0s.

CAN1 # Messages: A table listing received messages for CAN1. The table is highlighted with a red border in the original image.

Time	Op	Type	ID	Len	Data
1428580968	Wr	Std	123	8	12 34 45 56 67 78 aa BB
1428580971	Wr	Std	123	8	12 34 45 56 67 78 aa BB
1428580972	Wr	Std	123	8	12 34 45 56 67 78 aa BB

CAN2 # Messages: A table listing received messages for CAN2, which is currently empty.

Footer: The software version is 1.0.6, and the copyright is © 2014 Diamond Systems Corp. The website is www.diamondsystems.com.

11. API TO CONFIGURE AND MANAGE CAN PORTS ON WINDOWS

The source code for all windows user APIs to configure and manage the CAN ports are stored in "dsc_can2_pci_src" directory. User can include following files into their project directory. These API are dependent on CAN dll. User has to include these dll into their project directory.

common.h

dscud.h

dscud_os.h

mpedaq0804.h

pci_fpga.h

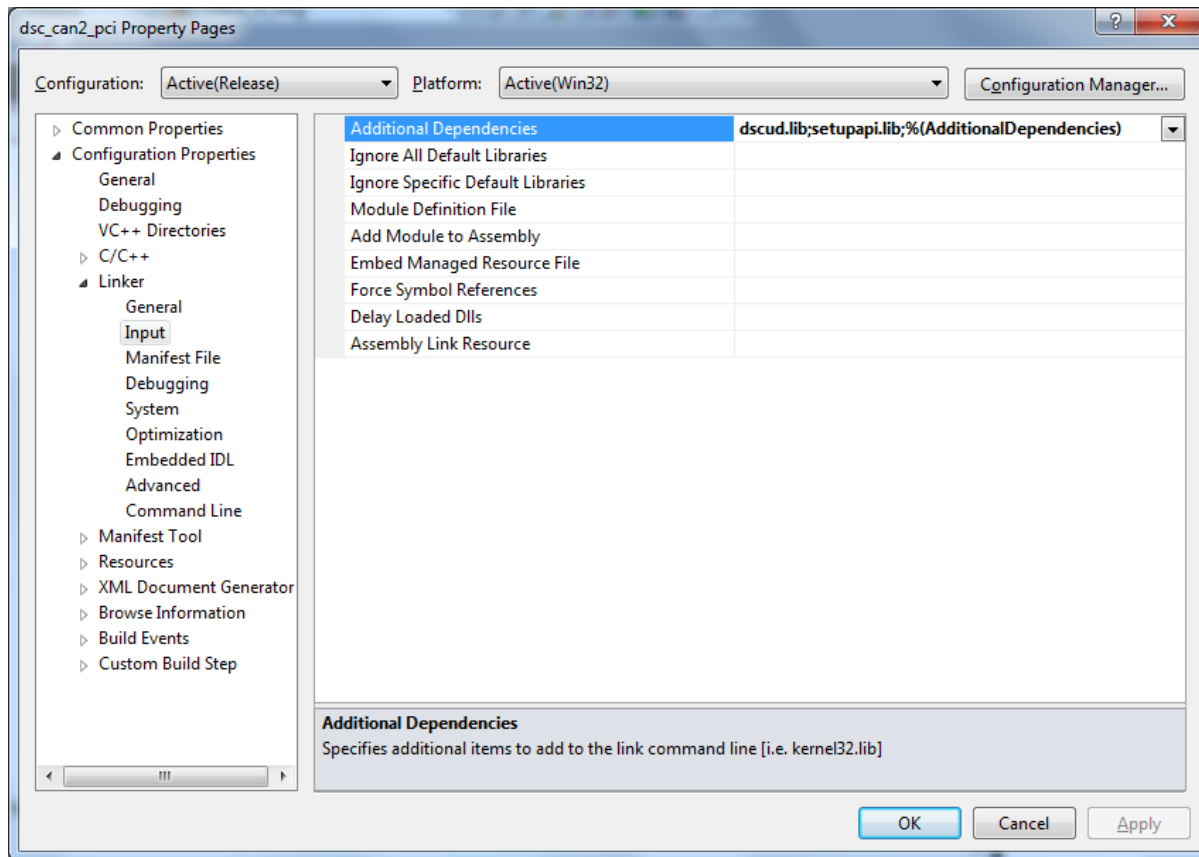

public.h

The APIs are dependent on lib and dll. User has include the below APIs into their project.

dscud.dll
dscud.lib

Project Settings -> Configuration Properties -> Linker -> Input ->

Modify Additional Dependencies : dscud.lib;setupapi.lib;%(AdditionalDependencies)

Opening the CAN device

```
OpenDevice(&GUID_DEVINTERFACE_FP_GPIO96, FILE_FLAG_OVERLAPPED );
```

This function should be called only once during initiation. It returns a valid handle if the driver detects the CAN device.

can_init(int can_ch): This API accepts the CAN interface number as an argument for the initialization. This will initialize CAN#0 or CAN#1. The value of can_ch should 0 for CAN#0 and 1 for CAN#1.

// Example : To initialize CAN#0 channel, pass the argument value as 0 to can_init function as shown below.

```
...
can_init (0) ; // Will initialize CAN#0 channel
```

Similarly, CAN#1 can be initialized by passing '1' as argument to can_init function as shown below

```
can_init (1); // Will initialize CAN#1 channel
```

Baud rate configuration.

set_baudrate(int can_ch, int baud rate): This API accepts the CAN interface number and the baudrate as arguments for configuring the baud rate of the specified CAN port.

// Set 500k Baud rate for CAN#0, Corresponding CAN channel values should be passed.

```
ret_val = set_baudrate(0, CAN_SPEED_500K) ;
```

Use below macros for setting the different baud rates. These macros can also be found in can.h file.

```
CAN_SPEED_1M  
CAN_SPEED_800K  
CAN_SPEED_500K  
CAN_SPEED_250K  
CAN_SPEED_125K  
CAN_SPEED_100K  
CAN_SPEED_50K  
CAN_SPEED_20K  
CAN_SPEED_10K
```

CAN Transmit & Receive :

FrameCANTxMsg() & check_rx_msg() : These function will be used to Transmit and Receive the CAN messages respectively.

CAN Transmit Prototype.

```
void FrameCANTxMsg(int can_ch, unsigned char msgType, unsigned int can_id, int len, unsigned char *data):
```

Assign the appropriate values, before calling the FrameCANTxMsg function.

can_ch: CAN port number, 0 for CAN#0 and 1 for CAN#1.

msgType = MSG_STANDARD ; // or MSG_EXTENDED .

can_id = 0x12; //if the msgType is MSG_STANDARD then the value should be in the range of **0x0 to 0x7FF** (11 bit value)

//Else if the msgType is MSG_EXTENDED then the value should be in range **0x0 to 0x1FFFFFFF** (29 bit value)

len = 4 //This field can be of 0 to 8 bytes length ; // CAN Transmit Data Length

data: This field depends on the len field.

If len is 4 then the CAN message data will be of 4 bytes long and each byte can range from 0x0 to 0xFF (8-Bit data)

```
data[0] = 0x1A ;
```

```
data[1] = 0xAB ;
```

```
data[2] = 0x22 ;
```

```
data[3] = 0x4D ;
```

```
FrameCANTxMsg(0, msgType, can_id, dlc, data) ;
```

The above sample code will transmit the CAN Standard message with CAN ID=0x12 of data length=4 and message data = {0x1A, 0xAB, 0x22, 0x4D} ;

CAN Receive Prototype.

```
int check_rx_msg( int can_ch, unsigned char *msgType, unsigned char *rx_data, unsigned int *can_id, unsigned char *can_msg_len);
```

Pass the appropriate pointers for calling the check_rx_msg function.

```
if ( check_rx_msg(0, &msgType, data, &can_id, &dlc) )
{
    If (msgType == MSG_STANDARD )
    {
        // Received message is CAN Standard Message.
    }
    else if (msgType == MSG_EXTENDED)
    {
        // Received message is CAN Extended Message.
    }
}
// dlc : Received CAN Data Length
// can_id : Will contain the received CAN Message ID
// Data of dlc length
printf("ID=%x DLC=%d Data : ", can_id, dlc) ;
for (i=0; i< dlc; i++ )
printf("%x ", data[i] ) ;
printf("\n") ;
}
```

The sample example programs for both transmit and receive can be found in the DSC_CAN2_PCI_V1.0.2_2015_01_13 directory for the reference.

Compile and build the CAN Application using VC++

12. SPECIFICATIONS

Number of ports	2 CAN 2.0B
Data rate	1Mbps
Number of receive buffers	31
Number of transmit buffers	1 high priority 16 standard priority
Acceptance filters	16 programmable, 29-bit
Identifiers	11-bit and 29-bit
Modes	Dual-independent Dual-redundant
Isolation	500V port-to-port and input-to-output
Input power	+3.3VDC +/-5%
Power consumption	0.462W @ 3.3V
Software drivers	Windows XP Linux 2.6.16, 2.6.27, 2.6.31, and 2.6.32
Operating temperature	-40°C to +85°C
MTBF	1,583,210 hours at 20°C
Dimensions	50.95mm x 30mm (2" x 1.18")
Weight	8.5g (0.3oz)
RoHS Compliant	Yes
